

Argus Advance

Executive Protection • Travel Intelligence

Turn hours of protective advance into minutes. Argus Advance assesses every stop of a trip — the threat picture, the way in and out, the nearest trauma care, and the venue itself — and answers your team's questions in plain language, on the device they actually carry. The same assessment is available in the operations center. For: detail leads, advance teams, corporate security, and family offices.

Why it matters

The advance shouldn't pull your team off the principal. A protective advance today is hours of scattered legwork — pulling crime data, mapping routes, locating trauma centers, vetting venues, and cross-checking a dozen feeds. Every one of those hours is an agent buried in paperwork instead of in the field. Argus Advance replaces that fragmented research with a single assessment any team member can open, trust, and act on — on the ground and in the operations center alike.

The model — ~90% done before arrival; your team owns the 10%

Argus Advance is not a replacement for your team — it is time and attention given back to it. The tool carries the research and assessment layer so the advance starts as close to the finish line as possible. The irreplaceable work — on-site confirmation, liaison and relationships, and the judgment and physical protection of the subject — stays with your people. The advance shifts from research to verification: the team walks in to confirm what is already assessed, faster and consistent on every trip.

Capabilities — what Argus Advance does

Each capability area produces a concrete deliverable your team can brief and act on.

Threat & situational intelligence LIVE

Threat assessment for any location — hot zones and elevated-risk areas — plus protests, encampments, and nuisance or high-danger areas. A crime report adds incident counts and types, trend versus baseline, a crime index, and pattern analysis, each zone backed by source-cited evidence.

Deliverable: *a sourced threat picture for every stop.*

Movement & route planning LIVE

Ingress and egress for each leg — primary, alternate, emergency extraction, and routes to avoid — with the ability to regenerate or roll back alternates as conditions change, and trace any route on the map.

Deliverable: *primary, alternate, extraction & avoid routes, ready to brief.*

Site & venue assessment — with Physical-Security Posture LIVE

Each venue gets access and drop-off, covered approach, egress and shelter-in-place, power and medical, parking and loading, entry points, fire systems, evacuation routes, and barriers — plus a Physical-Security Posture (PSA): posture ratings (Low/Medium/High per dimension), rated protective standards (UL752 ballistic / ASTM), building systems and sabotage vectors, a threat matrix, and staging. Media staging and access limits near the principal, and an "inside view" of published imagery to see a site in advance.

Deliverable: *a per-venue site card — with rated posture — an advance team can walk from.*

Venue-type advance checklist (USSS Universal Matrix) LIVE

A built-in Universal Site Assessment Matrix — 14 categories across roughly 240 checklist points — that auto-detects each venue's type (hotel, convention center, stadium, airport, hospital, house of worship, and more) and surfaces only the items that apply, so the on-site checklist matches the venue. Confirm a whole section at once or point by point; every mark is saved.

Deliverable: *a venue-type-correct advance checklist for each stop.*

Medical & emergency readiness LIVE

Nearest trauma care for every stop — Level 1 and Level 2 trauma centers, hospitals, and clinics — each in-scope health site run through its own site assessment focused on the ED/ICU ingress a detail would use, with an aerial view for line-of-sight. A dedicated medical-facility checklist validates the essentials: emergency and auxiliary power, on-site security and weapon screening, command-center coordination, a controlled physician and access list, layered access established before an emergency, response times, and capability match. Paired with police, fire, and EMS response times and pre-staged response plans.

Deliverable: *a validated medical plan — access, capabilities, sightlines, response — in hand before it is needed.*

Advance validation & evidence LIVE

Two custody-grade features. SME section validation: send a single report section to an outside subject-matter expert through a siloed, one-time, passcode-gated link — they validate or correct only that section, and the response returns with chain of custody, never exposing the rest of the report. Evidence library: attach large files — blueprints, floorplans, CAD, PDFs, photos — held in secure storage outside the report and reached by a short-lived, single-use link, so the assessment stays light while everything remains recallable. Reused with confidence: evidence and a section's validated determination now carry a proof-tier weight, so a venue already assessed and signed off can be recognized and its record reused on the team's later advances instead of rebuilt — and at trip close a validated advance checklist can be sealed and archived as an attributable, reusable record.

Deliverable: *outside-expert sign-off, a per-stop file repository, and reusable proof-tiered evidence — all with chain of custody.*

Live intelligence feeds LIVE

Assessments draw on multiple live sources — federal alerts, open-source intelligence, a law-enforcement signal, an estimated dark-web signal, social-media chatter, news, and geofenced events — with clickable citations back to the source.

Deliverable: *multi-source intelligence, current and attributable.*

Profile-tuned watch, under a protected name LIVE

Building a principal and trip profile tunes what the tool watches for — names, roles, affiliations, sensitivities — bound to the unique locations and timing of each stop. It works with the detail's own pseudonyms so the profile stays effective while the principal's identity stays protected.

Deliverable: *monitoring tuned to the principal and each location — under a protected name.*

Live OSINT monitoring & alerts ROLLING OUT

Once a trip is built, the watch-term set is defined and bound to each stop. Continuous, always-on screening against those terms — surfacing alerts as conditions change before arrival — is rolling out on the shared-team foundation.

Deliverable: *continuous OSINT tracking with alerts as conditions change.*

Planning workflow LIVE

Drop in an itinerary and Argus Advance builds the stops and runs the assessment automatically; or add stops by hand. Assessments pre-build so a stop opens instantly, and once built are retained and recallable — a completed advance is never lost across reopen or when switching between events. And a build that's still running survives an interruption — a reload, a redeploy, or a dropped connection — and resumes with a single tap, continuing only the stops that remain, so no completed work is ever repeated or lost.

Deliverable: *a complete, structured trip built in minutes — and it stays built.*

The Argus Advance assistant LIVE

A plain-language assistant answers the questions teams actually ask — "what's the egress at the hotel?", "nearest Level-1 trauma?" — grounded in the specific trip, with a choice of AI models from fastest to highest-fidelity.

Deliverable: *instant, trip-specific answers, no digging.*

Field & team tools LIVE

Phone-first and full-screen on desktop, with one-tap location awareness on the live map, a guided pre-flight walk that captures evidence of completion, an attributed activity trail (who did what), a supervisory pre-movement briefing export, large-text and voice accessibility, and one-tap feedback.

Deliverable: *the whole assessment in the agent's pocket.*

Trust & safety

Protective work is only useful if the information behind it is safe. Access is credential-gated and can be issued or revoked centrally — no shared password to leak (per-trip governance by a team lead is rolling out on this foundation). Trip records are encrypted at rest and identifying details are minimized. Privileged credentials, including third-party API keys, are held server-side, so a field device carries the work but never the platform's secrets. Third-party handling is privacy-preserving, and an attributed activity trail records who did what.

Assurance & limits

Argus Advance is decision-support. Assessments are point-in-time and coverage varies by region and deployment; figures used in demonstrations are illustrative. The tool standardizes and accelerates the advance — the protective decision, and the responsibility for it, remain with your team.

See Argus Advance on a real trip. Request a briefing and we will walk your team through a live assessment — from itinerary to sourced advance.
